

Study design: separate problems, predictions saved before response collection

Training answers

32 questions / 30 source families
Four subjects / standard prompt
5 models · 4 states · 2 requests
1,280 answers

Fix predictions

Fit and tune on training sources
Save predictions and fitted models
Primary tests and robustness checks
Before collecting test answers

Test answers

32 separate source families
Same subjects / standard prompt
5 models · 4 states · 2 requests
1,280 answers

Three research questions tested on the new responses

RQ1 · Recurring behavior

Repeat agreement and profiles
Two requests under identical inputs
Report how often each action occurs
32 new source families

RQ2 · Behavior prediction

Four nested predictors:
subject + state; model defaults;
model × subject; model × state
Losses averaged by source

RQ3 · Instruction effects

16 matched source families
Standard; neutral A/B; ASK; EXPLAIN
All student states; two requests
2,560 additional answers

Additional checks: 160 complete/missing-information answers + 40 reference-question replies.

All counts describe the fixed design. Repeated requests and prompt variants do not add independent sources.
