

Prospective design: separate sources, predictions saved before generation

Training answers

32 questions / 30 source families
Four domains / canonical role
5 models · 4 states · 2 requests
1,280 planned answers

Forecast lock

Fit and tune on training sources
Save forecasts and fitting choices
Primary and sensitivity panels
Before confirmation generation

New-source answers

32 separate source families
Same four domains / canonical role
5 models · 4 states · 2 requests
1,280 planned answers

Three questions evaluated on the confirmation responses

RQ1 · Recurring defaults

Repeat agreement and profiles
Two requests under identical inputs
Behavior rates reported alongside
32 new source families

RQ2 · Behavior prediction

Four nested forecasts:
situation; model defaults;
model × domain; model × state
Losses averaged by source

RQ3 · Prompt plasticity

16 matched source families
Canonical; neutral A/B; ASK; EXPLAIN
Crossed with states and repeats
2,560 additional answers

Supplementary probes: 160 complete/missing-information answers + 40 sentinel answers.

All counts describe the fixed design. Repeated requests and prompt variants do not add independent sources.
